Shrimp welfare estimates at Rethink Priorities

This report is part of a series estimating the number of shrimp in major European markets and how many are covered by established corporate welfare commitments. See our separate reports for estimates for the United Kingdom, France, and Spain. For all queries, please contact animalwelfare@rethinkpriorities.org.

About Rethink Priorities

Rethink Priorities is a research and implementation group that identifies pressing opportunities to make the world better. We act upon these opportunities by developing and implementing strategies, projects, and solutions to key issues. We do this work in close partnership with foundations and impact-focused nonprofits.

www.rethinkpriorities.org

Key Takeaways

- **Largest country-level market:** Of Spain, the UK, and France, we estimate that **Spain** has the largest **concentrated retail** market at approximately **3.59 billion** shrimp/yr (France ~3.49B; UK ~2.51B).
 - *Note:* On **apparent consumption** and **total retail**, **France** leads (apparent consumption ~69k tonnes/yr, total retail ~4.65B shrimp/yr).
- **Largest domestic retailer:** The largest single domestic retailer footprint we found is for **Mercadona** in **Spain**, estimated to source **~948 million** shrimp per year.
- **Largest multinational retailer:** Accounting for multinational footprints, **Carrefour** is the largest shrimp retailer that sells in the UK, Spain, or France at around **2.5 billion** shrimp per year worldwide. Of these, **~877 million** are sold in our focus countries (Spain ~338 M, France ~539 M); the remaining ~1.64B are rest-of-world.
- **Species variation:** Spain's imports are predominantly *Penaeus vannamei* (~97%, with ~1% *P. monodon*). The UK has a higher proportion of *P. monodon* (~17%), and France sits in between (~11% *P. monodon*, ~88% *P. vannamei*).
- **Policy coverage:** Across the **13** companies with published welfare policies in our focus countries, we estimate roughly **~1.86 billion** farmed shrimp per year are covered in our focus countries once all policies are fully implemented (UK ~1.43 B; France ~418 M; Spain ~45 M). Across these companies' full worldwide footprints, coverage extends to roughly ~2.82 B shrimp/yr.
- **Companies Not Yet Committed:** roughly **~6.23 billion shrimp/yr** are sold in Spain, France, and the UK by companies without corporate shrimp welfare commitments.
- **European shrimp retail markets are top-heavy:** **Mercadona** in Spain is ~26% of Spain's concentrated retail, and **Groupement E. Leclerc** in France is ~24%. Similarly, in the UK, **Tesco** is at ~23% of UK concentrated retail
- **Commitments are often for only part of a retailer's shrimp supply.** If every established commitment were extended to its full worldwide footprint, all products, and all relevant species — coverage would extend by roughly ~4.18 B additional shrimp/yr¹.

¹ Expansion estimates use country-wide own-brand fractions, not company-level data. See [Methods](#) section below for more detail.

- **Uncertainty:** Our 90% credible intervals range from roughly a factor of 3 (in the UK, where shrimp-specific market share data is available) to roughly one order of magnitude (in Spain and France, where we rely on general retail market shares as a proxy). Estimates outside focus countries are substantially more uncertain. Estimates for own-brand policies are also substantially more uncertain. Data for shrimp supply chains is generally scarce.

About This Report

Shrimp are the animal most commonly farmed for food, with [230 billion](#) alive at any point in time. Since 2021, several groups have worked to secure substantial shrimp welfare commitments from around 15 major retailers across the UK, France, and the Netherlands².

To understand what percentage of the supply chain these commitments affect, we estimate the number of shrimp affected by commitments established in the UK. We also estimate the number of farmed shrimp sourced in Spain and France, because preliminary data checks suggest these are Europe's largest farmed shrimp market ([Shrimp Insights, 2024](#); [Moulange et al., 2024](#)).

This European overview presents the aggregate picture: total market scale across all three countries, cross-border retail concentration, and corporate policy coverage. Country-specific analysis follows in three companion sections—one each for Spain, the UK, and France—each containing the full detail on market size, company estimates, uncertainty, and methods for that country. Our shared methodology, including Apparent Consumption calculations, weight estimates, and the uncertainty framework, is described once in the methods section below and applies across the estimates for the three separate country reports.

² Our estimates do not currently cover the Netherlands as we aim to focus on the largest farmed shrimp markets. This excludes two retailer commitments from our dataset.

The Aggregate Market

How large is the European farmed shrimp retail market across our three focus countries?

Market Scale And Species Composition

Country	Apparent consumption (farmed shrimp, tonnes/yr)	Market size (individuals/yr)				Species breakdown (% of farmed)	
		Total market	Retail market	Concentrated retail market	Mapped retailers	<i>P. vannamei</i>	<i>P. monodon</i>
Spain	63,179	5.32 B	3.99 B	3.59 B	3.18 B *	96.7%	1.4%
UK	47,281	3.98 B	2.79 B	2.51 B	2.44 B	81.2%	16.5%
France	68,999	5.81 B	4.65 B	3.49 B	2.47 B	88.4%	11.0%
Total	179,459	15.11 B	11.43 B	9.58 B	8.09 B	—	—

Together, the three countries represent ~179,000 tonnes/yr of farmed shrimp consumption, or roughly 15.1 billion individual shrimp per year at the total-market level.

Measuring by our **mapped companies**, **Spain** has the largest footprint at ~3.18 B shrimp/yr (overlap-adjusted)³, ahead of **France** (~2.47 B) and the **UK** (~2.44 B). The ranking differs at broader scopes: France leads on apparent consumption (~69 k tonnes/yr, vs Spain ~63 k, UK ~47 k) and total retail. Mapped-company coverage is highest in Spain (with Grupo IFA included) and the UK, and lowest in France, where the retail market has a longer tail of smaller, unmapped retailers.

The species breakdown differs across focus countries, which has implications for the scope of welfare policies.

Spain's imports are predominantly *P. vannamei* (~97%), reflecting its dominant trade with Ecuador and Venezuela. The UK has a higher proportion of *P. monodon* (~17%), and France sits in between (~11% *P. monodon*, ~88% *P. vannamei*).

³ Our estimates from Spain are adjusted for the overlap between retailers and distributors (who sit earlier in the supply chain, and sell shrimp to retailers).

Ranking Retailers On Domestic Size

Figure 1: Retailers from all three countries ordered by largest shrimp footprint in their own domestic market only

Of all the retailers mapped here, Mercadona in Spain sells the most shrimp in its domestic market (i.e., excluding multinational footprints), at approximately 948 million shrimp per year.

Cross-Border Retailers

Which companies span multiple focus countries, and how large are their combined supply chains?

Shared Retailers Across Markets

Several major retailers operate in many other countries. See Figure 2 for a breakdown of multinational retailers and their corporate welfare commitment coverage.

The largest multinational retailer shrimp footprint we found is **Carrefour**, selling roughly **2.52 billion** shrimp yearly worldwide. Carrefour operates in Spain and France among the countries covered in this report, and has a substantial worldwide footprint, including Brazil and Argentina. **Auchan** similarly bridges Spain and France (~338 M in the countries covered combined; ~492 M worldwide).

Figure 2: Retailers from at least one of our focus countries and operations in two or more countries total, with their estimated worldwide shrimp supply broken down by the number of shrimp covered by a welfare commitment (dark blue bars). Labels at the end of bars show total worldwide shrimp supply and the percentage covered by a commitment.

- **Carrefour** sells ~2.5 B shrimp/yr worldwide and is the largest company we've mapped.
- **Lidl** has a similar profile — ~2.0 B shrimp/yr worldwide with only the UK own-brand portion (~71 M) covered by a commitment currently. Lidl operates in all three of our focus countries.
- **Grupo IFA** — ~1.3 B shrimp/yr worldwide.
- Two retailers, ~1.1 B shrimp/yr combined, have very large proportions of their supply covered by a welfare commitment: **Marks & Spencer** (506 M of 518 M, because their commitment applies worldwide, to own-brand and non-own-brand products, and covers *P. vannamei* and *P. monodon*) and **Les Mousquetaires** (538 M of 609 M).

The multinationals are collectively very large. **Carrefour** (~2.52 B), **Lidl** (~2.03 B), and **Aldi Süd** (~1.07 B) each source over **1 billion** shrimp/yr worldwide, making each of them comparable in scale to the entire retail market in a single country covered in this report.

Aggregate Corporate Policy Coverage

How many farmed shrimp per year are currently covered by published welfare policies?

Policy Coverage Across Focus Countries

Country	Concentrated retail market (shrimp/Yr)	Covered by current policies (shrimp/Yr)	% covered	Gap (shrimp/Yr)
Spain	3.59 B	~45 M	~1%	~3.55 B
UK	2.51 B	~1.43 B	~57%	~1.08 B
France	3.49 B	~418 M	~12%	~3.07 B
All focus countries	9.58 B	~1.86 B	~19%	~7.72 B

Around ~19% of the concentrated retail market across the three countries is covered by published commitments, leaving ~7.7B shrimp/yr without coverage. The **UK** has the highest proportion at ~57% covered — driven by the broad set of UK-specific commitments (see our UK report for more information). **France** sits at ~12%, with coverage concentrated in Les Mousquetaires (Intermarché) plus multinational spillover.

Worldwide Footprint + Policy Coverage By Company

Accounting for the worldwide footprints of companies operating in our focus countries, what proportion are covered by established commitments?

Company	Worldwide sales (shrimp/Yr)	Covered by current policies (shrimp/Yr)	% covered
Marks & Spencer	518 M	506 M	98%
Sainsbury's	409 M	400 M	98%
Les Mousquetaires (Intermarché)	609 M	538 M	88%
Ocado Retail Ltd	48 M	22 M	46%
Co-op	35 M	16 M	46%
Morrisons	226 M	101 M	45%
ASDA	163 M	73 M	45%
Waitrose	129 M	55 M	43%
Tesco	661 M	276 M	42%
Aldi Nord	858 M	350 M	41%
Iceland	248 M	89 M	36%
Aldi Süd	1.07 B	323 M	30%
Lidl	2.03 B	71 M	3%
All companies with policies	~7.00 B	~2.82 B	~40%

Only about 40% of the worldwide footprint for companies with welfare commitments is actually covered.

Uncertainty And Limitations

Comparative Uncertainty Across Countries

Country	Market share proxy	90% CI for individual company estimates	Largest source of uncertainty
Spain	General retail market share	~1 order of magnitude	Market share proxy (+/- 2.5x)
UK	Farmed warm water shrimp market share (Seafish/Nielsen)	~Factor of 3	Shrimp weight (+/- 1.4x)
France	General retail market share	~1 order of magnitude	Market share proxy (+/- 2.5x or larger)
Outside focus countries	Location-based extrapolation	>1 order of magnitude	Location-based extrapolation (+/- 3x)

The UK estimates are the tightest because we have shrimp-specific market share data from [Seafish \(based on Nielsen data\)](#). Spain's uncertainty ranges are wider because we rely on general retail market shares as a proxy for the farmed shrimp market. France's estimates are similarly wide because we also rely on general retail market shares as a proxy. For estimates outside the three focus countries (i.e., the worldwide portions of multinational retailers' footprints), we extrapolate via the company's share of physical locations in each country (see Uncertainty Estimates for the per-driver breakdown).

We apply a dependence assumption across uncertainty sources (working additively in log space) to widen our credible intervals relative to what an independence assumption would yield. In the absence of data to support independence, we consider this additional uncertainty warranted. For a fuller discussion of our uncertainty framework, see the country-specific Methods sections.

Limitations

- **Unmapped retail companies:** Within each country's concentrated retail market, our mapped companies cover roughly **UK ~97%**, **Spain ~89%**, **France ~71%** of the

concentrated retail estimate. Note that we map a few entities (like Spain's Grupo IFA) that are retail companies but not consumer-facing top retailers, so coverage of consumer-facing retail alone is somewhat lower for Spain.

- **Retail sector only:** This report assesses the **retail sector** only. The HORECA sector (hotels, restaurants, catering) is likely smaller than retail in all three countries; other sectors are out of scope.
- **Processing state:** Due to low data availability, we use [US import data](#) as a proxy for the processing state of shrimp at import in all three countries. The actual processing state mix may differ across countries.
- **Snapshot in time:** Estimates are based on 2025 data or the most recent data available. Market shares, import patterns, and corporate policies will evolve.

Methods

This section describes the methodology shared across all three country reports. Country-specific methodological details are in the respective country sections.

Core Calculation

For each company, we estimate the number of farmed shrimp sold per year as:

Farmed shrimp retail market (individuals)

=

Apparent consumption of farmed shrimp (predominantly *P. vannamei* and *P. monodon*, tonnes)

÷

Mean weight per shrimp at import (tonnes/individual)

×

Company's market share in the farmed shrimp retail market

For international footprints, we further multiply by the inverse of the company's share of locations in the focus country.

Apparent Consumption

We calculate Apparent Consumption of farmed shrimp, by Species Group, as:

$$\text{Apparent Consumption} = \text{Imports} - \text{Exports} + \text{Production}$$

using FAO data on [trade flows](#) and [production](#). We classify each trade flow by HS code and source country production profile to estimate the farmed *Penaeus* portion. Full details are in the country-specific appendices.

Weight Estimation

We estimate the average weight of shrimp at import at **11.9g**, based on [FishCount research](#) of *P. vannamei* live weight, adjusted for estimated processing state at import. We use [US import data](#) as a proxy for processing state proportions (67% peeled, 17% HLSO, 17% HOSO; percentages rounded). The full range from FishCount loosely bounds our uncertainty.

Market Share Proxies

The quality of market share data varies across countries:

- **UK:** Farmed warm water shrimp market shares from [Seafish/Nielsen](#). This is a close proxy for the market share of interest.
- **Spain:** General retail market shares from [Numerator World Panel](#) and [Algori](#). This is a loose proxy—based on UK calibration data, the ratio of general retail share to farmed shrimp share can vary by roughly +/-2.5x across companies.
- **France:** General grocery retail market shares from [Numerator World Panel](#) (France). As in Spain, this is a loose proxy and the dominant uncertainty driver (±2.5x or larger).

Established Corporate Shrimp Welfare Policies

To estimate the potential coverage of corporate welfare policies, we disaggregate each company's sourcing into the various aspects a commitment may cover: country of operation, own-brand vs. non-own-brand product lines, and species. We then match each company's published welfare policy against these segments to estimate the number of animals covered once the policy is fully implemented.

Cross-Border Calibration Of Estimates

By assessing the sensitivity of our results to the choice of country from which we extrapolate, we can get a rough sense of the uncertainty introduced by the extrapolation. It introduces a factor of roughly $\pm 3x$. We found this as follows:

Outside of focus countries, we generally extrapolate our estimates using the proportion of locations or revenue a company reports in each country, preferring extrapolation from the UK over Spain over France, due to data availability.

However, to get a sense of the potential uncertainty introduced by this loose extrapolation method and selection of root country, we calculated that Lidl estimates vary from 1.6B extrapolating from France to 4.2B if we extrapolate from Spain, a difference of a factor of 2.6x. Carrefour and Auchan — also significant in 2 of our focus countries — give factors of 2.6x and 2.4x, respectively. Given the limited information here, we round to $\pm 3x$.

Treatment Of Uncertainty

We assume dependence between uncertainty sources and work additively in log space. This widens credible intervals relative to an independence assumption. We catalog uncertainty sources for each country in our spreadsheets and provide 90% subjective credible intervals for company-level estimates where possible.

Potential Future Work

Potential future work:

Depending on time and funding availability, we may do the following, but we cannot yet commit to doing so:

- Maintain this tracker into the future, including streamlining the calculation process to allow for more researchers to use and modify
- Research additional countries
- Validate the market share method by purchasing scanner/panel data (e.g., from Circana/IRI, Numerator/Kantar Worldpanel) to independently calculate domestic retailer shrimp sales

- Estimate the number of shrimp covered by own-brand vs. non-own-brand portions of supply chains for each company, not for just each country

Notation & definitions

- **Concentrated Retail Market:** the portion of the food retail market made up of identifiable, large companies (whether or not actually identified and estimated in this report). Typically, major corporations in the supermarket and hypermarket businesses.
- **Policy Coverage:** What farmed shrimp sales for a certain company fall under the policy. Notably, policies sometimes exclude certain geographies, product lines, species, or other limits.
- **Sourcing Segment:** A technical term we use to refer to one row in the underlying data (company × country × own-brand-or-not × species). For example: Tesco's sales of *P. vannamei* through own-brand products in the UK.
- **Mapped Company:** A company that is included in our dataset.
- **Trade Flow:** A specific commodity shipped between two countries, identified by HS code, source country, destination country, and weight. Each Trade Flow is the most granular unit of our Apparent Consumption analysis.
- **Country of Focus:** The reference country for a given calculation — e.g., the UK or Spain. Apparent Consumption, import/export volumes, and market size estimates are all computed relative to the Country of Focus.
- **Species Group:** A classification of shrimp Trade Flows by species or species category, based on HS code descriptions and source country production data. Examples include: farmed *Penaeus* (covering *P. vannamei* and *P. monodon*), warm-water shrimp, cold-water shrimp, and *Penaeus* spp.
- **Policy Expansion:** A hypothetical change to a published shrimp welfare commitment that would increase the shrimp/yr it covers — i.e., extending the commitment's scope to additional product lines, additional geographies, or additional species, where the original commitment did not cover them.
 - **Brand Expansion:** The shrimp/yr that would be additionally covered if a company kept its existing commitment's geographies and species but extended product scope from own-brand only to all products it sells (own-brand + branded).

- **Worldwide Expansion:** The shrimp/yr that would be additionally covered if a company kept its existing commitment's product scope and species but extended geographic scope from its current covered geographies to its full worldwide footprint.
- **Species Expansion:** The shrimp/yr that would be additionally covered if a company kept its existing commitment's geographies and product scope but extended species coverage beyond those species the policy currently covers (e.g., adding *P. monodon* to a *P. vannamei*-only commitment).
- **Full Expansion:** The shrimp/yr that would be additionally covered if a company extended its commitment across all three dimensions — brand, worldwide, and species — to its full worldwide footprint across product lines and farmed shrimp species.

Appendix — Data sources and detailed methods

Imports: Apparent Consumption of Shrimp

How much farmed shrimp is consumed in each country?

We calculated the farmed shrimp market size by analyzing import/export (ImpEx) Trade Flows from various countries. A Species Group is a classification of shrimp by species or species category (e.g., farmed *Penaeus*, warm-water shrimp, cold-water shrimp). Our calculations are based on data from the FAO covering 2023 [farmed and wild-caught production](#) and [Trade Flows](#), by weight.

We calculate Apparent Consumption by Species Group, in tonnes, as:

Apparent Consumption = Imports - Exports + Production

Our approach to estimating Apparent Consumption consists of four main steps. First, we classify each Trade Flow's HS code into relevant species groupings by what it tells us about Species Group and production methods, based on HS code descriptions. Then, we classify the proportion of species within each import Trade Flow that is farmed by applying proportional estimates derived from the source country's (the country sending the shrimp) production data. We use this to estimate imports by Species Group. Third, for exports, we aggregate the Country of Focus's (the country receiving the shrimp) imports and use this as the basis for similar proportional estimations. Finally, we checked the production tonnages in each country.

Here we present that method in more detail:

1. **HS Code classification:** We split import activity into the most detailed Trade Flows available from the FAO—by HS code and source country. For each HS code, we classify it into a Species Group: warm-water shrimp, cold-water shrimp, *Penaeus*, any shrimp, etc.

Example: The HS code "shrimp and prawns (*Penaeus* spp.), frozen" is classified into the *Penaeus* Species Group based on the species named in the code description. In the next

step, this allows us to hone in on farmed versus wild production among *Penaeus* shrimp in the producer country.

2. **Species Group estimation based on source country production:** For each Trade Flow, we examine the source country's FAO production data, which includes species-level detail on farmed and wild-caught volumes. We then calculate a midpoint estimate by assuming the source country's production distribution applies to that Trade Flow.

Example: Spain imports "shrimp and prawns, other than coldwater, even smoked, frozen" from China. This HS code is classified as warm-water shrimp. Within China's warm-water shrimp production, 74% is farmed. Our midpoint estimate for the farmed portion of this Trade Flow is therefore the volume $\times$ 74%.

This two-phase approach—classify broadly, then estimate proportionally—makes midpoint estimation natural across HS codes and source countries, and extends straightforwardly to any focus country.

3. **Exports:** We apply a similar approach to exports. However, instead of basing estimates on the producer country's production data, we base the estimates on the Country of Focus's import composition from the prior step.

Example: France exports 1.75K tonnes of "shrimp and prawns, prep. or pres., in airtight containers" to Germany. Since 63% of France's imports are farmed shrimp, we assume, for our midpoint estimate, that 63% of France's exports will be farmed shrimp. Hence, we estimate that 1.11K tonnes of this trade flow are farmed shrimp.

Note that export volumes are substantially smaller than imports in our focus countries.

4. **Local production:** We reviewed [FAO production data](#) and found local farmed shrimp production to be negligible in our focus countries:

- **Spain:** Farmed *P. vannamei* production is approximately [600 tonnes](#) annually, virtually all farmed, with [only 34 tonnes additionally farmed in Portugal](#).
- **UK:** No reported farmed *Penaeus* production per the FAO.
- **France:** No reported farmed *Penaeus* production per the FAO.

Uncertainty. We loosely estimate $\pm 20\%$ uncertainty in the farmed shrimp Apparent Consumption, due to:

- Ambiguity in proportional estimation for some source countries (e.g., in Spain, China's HS030617 imports could amount to up to $\pm 5.7\%$ of total imports)
- Moderate uncertainty around export estimation
- Additional sources of uncertainty in smaller Trade Flows and miscellaneous classification edge cases

Why Make Our Own Apparent Consumption Estimates?

We selected this approach because...

- An international source covering consumption in all relevant countries was not readily available
- While some countries have more specific sources for their own country, those that we found were generally either not comparable across countries or not clear enough to determine whether they are comparable
- Some sources that are available cover similar concepts, but do not break results down by farmed shrimp, or *P. vannamei* and *P. monodon* specifically, and are ultimately derived from effectively the same import/export data
- This approach gives transparent insight into the nature of estimates and related uncertainty, and permits cross-country comparisons

Cross-Country Aggregation

When summing across multiple countries (e.g., total shrimp coverage from a multinational policy, total mapped retail across all three focus countries), we apply each country's per-segment estimate independently, then aggregate. Where a multinational policy spans multiple of our focus countries (e.g., Marks & Spencer worldwide; Aldi Süd worldwide; Tesco UK + Republic of Ireland), we sum the per-country contributions; for spillover into non-focus countries, see "Multinational extrapolation" below.

Cross-Country Calibration

Where a company operates in more than one of our focus countries, we can compare the worldwide estimates derived independently from each country's data. This provides a useful (though limited) calibration check.

The most actionable case is **Lidl**, which operates in all three focus countries:

- Lidl worldwide, derived from UK data: ~2.0B shrimp/yr.
- Lidl worldwide, derived from Spain data: differs by a meaningful factor, illuminating the looseness of the general-retail-as-proxy assumption used for Spain (vs. the shrimp-specific Seafish data used for the UK).

We use this divergence as one input into the calibration of our $\pm 3x$ multinational-extrapolation uncertainty band.

Comparative Uncertainty Across Countries

Our 90% credible intervals vary materially by country, driven primarily by the quality of each country's market-share data:

Country	Market-share proxy	90% CI for individual company estimates	Key driver
 UK	Farmed warm-water shrimp share (Seafish/Nielsen)	~Factor of 3	Shrimp weight ($\pm 1.4x$), policy coverage ($\pm 1.5x$)
 Spain	General retail share (Numerator + Algori)	~1 order of magnitude	Market-share proxy ($\pm 2.5x$)
 France	General retail share (Numerator)	~1 order of magnitude	Market-share proxy ($\pm 2.5x$)
 Outside focus countries	Location-based extrapolation	>1 order of magnitude	Location-based extrapolation (+/- 3x)

For example, this table gives our credible intervals for key values:

Country	Total Retail Market	Concentrated Retail Market	Top Company
 UK	2.0B - 6.4B	815M - 5.7B	336M - 1.0B (Tesco)
 Spain	2.4B - 9.3B	964M - 8.3B	287M - 3.1B (Mercadona)
 France	3.1B - 9.1B	1.1B - 7.3B	185M - 2.0B (Groupement E. Leclerc)

The UK estimates are tightest because Seafish provides shrimp-specific market shares directly; Spain and France estimates are wider because of the general-retail-as-proxy step.

Limitations

- **HORECA and other sectors are excluded.** We assess the retail sector only across all three countries. The HORECA sector (hotels, restaurants, catering) and other sectors are likely smaller than retail in each country, but we did not precisely estimate them.
- **Unmapped retail companies.** In each country, the largest retailers are mapped, but not the entire retail market. The percentage of the total that we mapped varies by country.
- **Processing state proxy.** [US import data](#) is used as a proxy for the processing state of shrimp at import in all three countries; the actual processing-state mix may differ cross-country.
- **Snapshot in time.** Estimates are based on 2025 data. Market shares, import patterns, and corporate policies will evolve.
